Accredited with 'B++' Grade by NAAC

PANDAS

- Pandas stand for Panel Data System
- Pandas is an open source library for data analysis, Data manipulation and Data Visualization.
- (OR) Pandas provide powerful data structures for data analysis, time series and statistics.
- Pandas works on the top numpy and matplotlib.

Features of pandas

- 1. Handling huge amount data
- 2. Missing Data
- 3. Cleaning up data
- 4. Alignment and indexing
- 5. Merging and joining
- 6. Grouping and Visualizing data
- 7. Time Series Functionality
- 8. Allows to load data from multiple file formats
- 9. Input and Output Tools

Pandas library is used by scikit-learn for ML

Applications of Pandas

- 1. Recommendation Systems
- 2. Stock Prediction
- 3. Big Data and Data Science
- 4. NLP (Natural Language Processing)
- 5. Statistics and Analytics
- 6. Neuroscience

Important data structures of Pandas are,

- 1. Series
- 2. DataFrame

Q: What is data analysis?

Data analysis is process of collecting, transforming, cleaning and modeling the data with goal of discovering required information.

Data analysis process consists of the following steps.

PATEL GUDA, IBRAHIMPATNAM (M), R.R.Dist, 501510, T.S

Ph.No. 08415-201345, www.avniet.ac.in, Email: avn.principal@gmail.com

Accredited with 'B++' Grade by NAAC

- 1. Data Requirement Specifications
- 2. Data Collection
- 3. Data Processing
- 4. Data Cleaning
- 5. Data Analysis
- 6. Communication

What is Series?

Pandas series is a one dimensional array object, this object can hold data of any type. It can be integers, floats, string or python objects.

Pandas series represents or equal to a column in any data base (MsExcel, Oracle, MySQL, SQLServer,..)

What is DataFrame?

DataFrame is a two dimensional array object or data structure. Data stored tabular format, which is rows and columns.

The Dataframe consist of 3 components.

- 1. Data
- 2. Rows
- 3. Columns

How to install pandas?

Other than jupyter and googlecolab, it is required to install pandas lib.

pip install pandas

Pandas Series

Series is single dimension array like object with homogeneous or heterogeneous data

Series object can be created in different ways.

- 1. Using array
- 2. Using Dictionary
- 3. Using Scalar values
- 4. Using other iterables

Series is name of the class or type which is used to construct Series object.

Syntax: Series(data,index,dtype)

PATEL GUDA, IBRAHIMPATNAM (M), R.R.Dist, 501510, T.S

Accredited with 'B++' Grade by NAAC

Data: the source using which series object is created

Index: index values must hashable and must be unique/access labels

dtype: type of the series is defined using dtype.

Creating Empty Series

b 20 c 30 d 40 e 50 dtype: int64

```
import pandas as pd
import numpy as np
s1=pd.Series(dtype=np.int8)
print(s1)

Series([], dtype: int8)
```

Creating Series using List object

```
$2 = pd. Series([10,20,30,40,50])
print($2)
$3 = pd. Series([10,20,30,40,50],index=['a','b','c','d','e'])
print($3)

$\begin{align*} \text{0 & 10 \\ 1 & 20 \\ 2 & 30 \\ 3 & 40 \\ 4 & 50 \\ dtype: int64 \\ a & 10 \end{align*}
$\text{0 & 10 \\ 1 & 20 \\ 2 & 30 \\ 3 & 40 \\ 4 & 50 \\ dtype: int64 \\ a & 10 \end{align*}
$\text{10 & 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 10 \\ 1
```

PATEL GUDA, IBRAHIMPATNAM (M), R.R.Dist, 501510, T.S

Ph.No. 08415-201345, www.avniet.ac.in, Email: avn.principal@gmail.com

Accredited with 'B++' Grade by NAAC

Creating Series using ndarray

```
a=np.ndarray(shape=(5,))
   i=0
   for value in range(10,60,10):
        a[i]=value
   print(a)
   print(type(a))
   s=pd.Series(a)
   print(s)
[10. 20. 30. 40. 50.]
   <class 'numpy.ndarray'>
       10.0
       20.0
       30.0
       40.0
      50.0
   dtype: float64
```

Creating Series Using Dictionary

We can create series using dictionary (OR) we can pass the dictionary object to series.

Series object is using dictionary values as data and dictionary keys as index labels.

```
sales_dict={2018:50000,2019:60000,2020:75000}
   s=pd.Series(sales dict)
   print(s)
   emp_dict={'naresh':5000,'suresh':6000,'kishore':9000}
   s=pd.Series(emp_dict)
   print(s)
€ 2018
          50000
   2019
          60000
   2020
          75000
   dtype: int64
          5000
   naresh
   suresh
            6000
   kishore
            9000
   dtype: int64
```

Creating Series using Scalar values

If the series is created using scalar values we must define index. This index defines the length of series.

PATEL GUDA, IBRAHIMPATNAM (M), R.R.Dist, 501510, T.S

Accredited with 'B++' Grade by NAAC

```
s=pd.Series(15,index=[0,1,2,3,4])
print(s)

0     15
1     15
2     15
3     15
4     15
dtype: int64
```

Accessing Data from Series

Series is index based collection, we can read and manipulate data using index. This index starts with 0.

```
$1=pd.Series([100,200,300,400,500])
   print(s1)
   print(s1[0],s1[1],s1[2],s1[3],s1[4])
   s2=pd.Series([1000,2000,3000,4000,5000],index=['a','b','c','d','e'])
   print(s2['a'],s2['b'],s2['c'],s2['d'],s2['e'])
   print(s2[0],s2[1],s2[2],s2[3],s2[4])
C→ 0
       100
       200
       300
       400
      500
   dtype: int64
   100 200 300 400 500
   1000 2000 3000 4000 5000
   1000 2000 3000 4000 5000
```

Reading multiple elements/values from series

Series allows reading multiple elements by defining index labels within list.

Series allows slicing, to read multiple elements/values.

PATEL GUDA, IBRAHIMPATNAM (M), R.R.Dist, 501510, T.S

Ph.No. 08415-201345, www.avniet.ac.in, Email: avn.principal@gmail.com

Accredited with 'B++' Grade by NAAC

```
s1=pd.Series(range(100,1000,100))
   print(s1)
   print(s1[:3])
   print(s1[-3:])
   print(s1[-1::-1])
C→ 0
       300
   3
       400
   4
       500
   5
       600
       700
       800
       900
   dtype: int64
      100
   1 200
      300
   dtype: int64
       700
       800
       900
   dtype: int64
       900
       700
       600
                                                       / On completed at 7:05 DM
```

DataFrame

DataFrame is two dimensional array object with heterogeneous data. In DataFrame data is stored in the form of rows and columns.

DataFrame represents a table in database.

How to create DataFrame?

DataFrame can be created in different ways.

- 1. Series
- 2. Lists
- 3. Dictionary
- 4. Numpy array
- 5. From another dataframe
- 6. Data can read from files or database

"DataFrame" is type or class name, to create dataframe object

Syntax:

DataFrame(data,index,columns,dtype)

PATEL GUDA, IBRAHIMPATNAM (M), R.R.Dist, 501510, T.S

Ph.No. 08415-201345, www.avniet.ac.in, Email: avn.principal@gmail.com

Accredited with 'B++' Grade by NAAC

data: data is taken from various sources

Index: row labels

columns: columns labels

dtype: data type of each column

Creating empty dataframe

```
import pandas as pd
#creating empty dataframe
df=pd.DataFrame()
print(df)
Empty DataFrame
Columns: []
Index: []
```

Creating DataFrame using dictionary

Dictionary consist of key and values.

Dictionary keys as columns headers and values are columns values

```
d={'empno':[1,2,3,4,5],'ename':['naresh','suresh','rajesh','kishore','raman'],'sal':[5000,6000,7000,9000,6000]}
df=pd.DataFrame(d)
print(df)

empno ename sal
0 1 naresh 5000
1 2 suresh 6000
2 3 rajesh 7000
3 4 kishore 9000
4 5 raman 6000
```

Create DataFrame using List

A nested list represents the content of dataframe.

Each list within list is represented as row.

PATEL GUDA, IBRAHIMPATNAM (M), R.R.Dist, 501510, T.S

Ph.No. 08415-201345, www.avniet.ac.in, Email: avn.principal@gmail.com

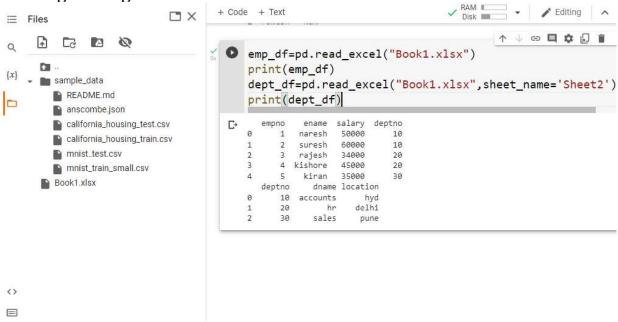

Accredited with 'B++' Grade by NAAC

DataFrame created with missing data

Missing data is identified with NaN(Not a Number)

```
D data=[['naresh',45],['suresh',56],['kishore',65],['rajesh']]
    df=pd.DataFrame(data,columns=['name','age'])
    print(df)
\Box
         name
               age
     naresh 45.0
       suresh 56.0
    2 kishore 65.0
    3 rajesh NaN
data=[{'name':'naresh','age':45},{'name':'kishore'},{'name':'suresh'},{'age':50},{}]
   df=pd.DataFrame(data,index=['p1','p2','p3','p4','p5'])
   print(df)
        name
\mathbb{C}^*
             age
   p1
      naresh 45.0
   p2 kishore
             NaN
   p3 suresh
   p4
        NaN 50.0
   p5
        NaN
             NaN
```

Reading/loading data from ms-excel

Selecting Data

1. Row Selection

PATEL GUDA, IBRAHIMPATNAM (M), R.R.Dist, 501510, T.S

Ph.No. 08415-201345, www.avniet.ac.in, Email: avn.principal@gmail.com

Accredited with 'B++' Grade by NAAC

2. Column Selection

Column Selection

Selecting columns from DataFrame can be done using column header.

```
data=[{'name':'naresh','age':45},{'name':'kishore'},{'name':'suresh'},{'age':50},{}]
   df=pd.DataFrame(data)
   print(df)
   c1=df['name']
   c2=df['age']
   print(type(c1), type(c2))
   print(c1,c2)
C+
   0 naresh 45.0
   1 kishore
     suresh
        NaN 50.0
   <class 'pandas.core.series.Series'> <class 'pandas.core.series.Series'>
      kishore
       suresh
           NaN
   Name: name, dtype: object 0 45.0
        NaN
        NaN
       50.0
        NaN
   Name: age, dtype: float64
```

Reading multiple columns from DataFrame

In order to read multiple columns, the column names must be defined as a list. It return multiple columns as a dataframe.

single column it read as a series.

```
data={'a':[1,2,3,4,5],'b':[100,200,300,400,500],'c':[1000,2000,3000,4000,5000],'d':[10000,20000,30000,40000,5000],'d':[10000,20000,30000,40000,5000]]}

df=pd.DataFrame(data)
    print(df)
    print(df[['a','c']])
    r=df[['a','c']]
    print(r)
    print(type(r))

Accredited with 'B++' Grade by NAAC

MATPLOTLIB

Matplotlib is a low level graph plotting library in python that serves as a visualization utility. Matplotlib was created by John D. Hunter. Matplotlib is open source and we can use it freely. Matplotlib is mostly written in python, a few segments are written in C, Objective-C and Javascript for Platform compatibility.

Types of Matplotlib

Matplotlib comes with a wide variety of plots. Plots help to understand trends, and patterns, and to make correlations. They're typically instruments for reasoning about quantitative information. Some of the sample plots are covered here.

- Matplotlib Line Plot
- Matplotlib Bar Plot
- Matplotlib Histograms Plot
- Matplotlib Scatter Plot
- Matplotlib Pie Charts
- Matplotlib Area Plot

Import Matplotlib

```
import matplotlib
   Checking Matplotlib Version
import matplotlib
print(matplotlib.__version__)
import matplotlib.pyplot as plt
```

PATEL GUDA, IBRAHIMPATNAM (M), R.R.Dist, 501510, T.S

Accredited with 'B++' Grade by NAAC

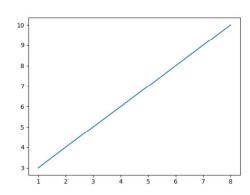

LinePlot

Draw a line in a diagram from position (0,0) to position (6,250):

```
import matplotlib.pyplot as plt
import numpy as np

xpoints = np.array([0, 6])
ypoints = np.array([0, 250])

plt.plot(xpoints, ypoints)
plt.show()
```

SCATTER PLOT

```
import numpy
import matplotlib.pyplot as plt
numpy.random.seed(2)

x = numpy.random.normal(3, 1, 100)
y = numpy.random.normal(150, 40, 100) / x

plt.scatter(x, y)
plt.show()
```

BOXPLOT

```
# Import libraries
import matplotlib.pyplot as plt
import numpy as np

# Creating dataset
np.random.seed(10)
data = np.random.normal(100, 20, 200)
fig = plt.figure(figsize =(10, 7))
# Creating plot
plt.boxplot(data)
# show plot
plt.show()
```

```
# Import libraries
import matplotlib.pyplot as plt
import numpy as np
# Creating dataset
np.random.seed(10)
data_1 = np.random.normal(100, 10, 200)
data_2 = np.random.normal(90, 20, 200)
data_3 = np.random.normal(80, 30, 200)
data_4 = np.random.normal(70, 40, 200)
data = [data_1, data_2, data_3, data_4]
fig = plt.figure(figsize =(10, 7))
# Creating axes instance
ax = fig.add_axes([0, 0, 1, 1])
# Creating plot
bp = ax.boxplot(data)
# show plot
plt.show()
```

Output:
